TRIENNIAL REPORT

OF THE

CIVIL HOSPITALS AND DISPENSARIES

IN THE

MADRAS PRESIDENCY

FOR THE YEAR

1916

MADRAS:
PRINTED BY THE SUPERINTENDENT, GOVERNMENT PRESS.

1917.

OFFICE OF THE SURGEON-GENERAL
WITH THE GOVERNMENT OF MADRAS,
25th June/19th July 1917.

No. 63/475

From

THE HON. SURGN.-GENL. W. B. BANNERMAN, C.S.I., K.H.P., M.D., D.SC., I.M.S.,
Surgeon-General with the Government of Madras,

To

THE SECRETARY TO GOVERNMENT,
LOCAL AND MUNICIPAL DEPARTMENT,
MEDICAL SECTION.

SIR,

I have the honour to submit the following triennial report on the working of the Hospitals and Dispensaries under the Government of Madras during the years 1914, 1915 and 1916.

I have the honour to be,
Sir,
Your most obedient servant,
W. B. BANNERMAN,
C.S.I., K.H.P., M.D., D.SC., I.M.S.,
Surgeon-General with the Government of Madras.

SOME PRINCIPAL STATISTICS FOR 1916.

Area excluding Anjengo ...			142,229 sq. miles
Population (census of 1911) ...			41,399,832
Population (estimated to middle of 1916) ...			43,684,054
Number of Medical Institutions ...			709
Proportion of Medical Institutions to area ...			1 per 200 sq. miles (roughly)
Proportion of Medical Institutions to population ...			1 per 60,000 (roughly)
Number of Registered Medical Practitioners ...			1,354
Number of all Medical Practitioners (according to census of 1911) including all Vydians, Hakeems, etc. ...			25,108
* Number of patients treated...	In-patients ...	98,370	7,562,890
	Out-patients ...	7,464,520	
* Death-rate among in-patients ...			4·11 per cent
Number of labours conducted ...	Normal ...	42,244	47,331
	Abnormal ...	5,087	
Number of births registered during the year ...			1,301,597
* Number of operations performed...	Selected ...	16,368	295,742
	Non-selected ...	279,374	
* Death-rate among patients operated on ...			0·21 per cent
* Receipts ...			Rs. 31,11,127
* Expenditure ...			Rs. 31,09,071
* Average daily cost of diet per patient ...	City ...		As. 5-8
	Mufassal ...		As. 2-7
* Average cost per patient (excluding "building," "diet" and "investments" ...	City ...		Rs. 1-10-5
	Mufassal ...		As. 3-8

* Refers only to State-public, Local Fund and Private-aided Institutions.

TRIENNIAL REPORT

ON THE WORKING OF THE

CIVIL HOSPITALS AND DISPENSARIES

FOR THE YEAR 1916.

Hospitals and Dispensaries (*Statement A*).—The total number of medical institutions open to the public on 31st December 1916 was 709 against 684 on 31st December 1913, showing a net increase of 25. This works out roughly to one institution for every 200 square miles of area and every 60,000 of the total population. Of these, the number of general institutions was 668 against 643 at the close of 1913 (an increase of 25) while the institutions for women and children (who number over half of our general population) showed no increase at all, remaining at 41. While the provision of 668 general institutions for a population of over 43 millions (one institution for about 65,000 of the general population) cannot be characterized as too liberal, the provision of 41 institutions for the whole of the women and children of our Presidency is certainly very inadequate. These last remarks apply to the country districts—not to the Presidency town in which the wants of women and children are more adequately provided for.

2. A question closely related to the inadequacy of medical relief is this; the number of private medical practitioners who can supplement the work of public institutions is very small in this country as compared with the United Kingdom, where, according to the latest available figures, the number of registered medical practitioners at the close of 1915 was 43,325 for a population of about 45 millions, while in the Madras Presidency, with a population of over 43 millions (or roughly speaking, about the same as that of the United Kingdom), there were only 1,354 at the close of 1916. According to the census of 1911, the number of medical practitioners of all descriptions was only 25,108; and this number includes all vaidyans, hakeems, veterinary surgeons, and that large class of blatant quacks whose dangerous practices are unfortunately still rampant all over the country. Even our very small number of registered medical practitioners is not distributed uniformly throughout the land, there being a concentration of them in and around our large towns and cities, while the supply in rural areas generally, and in the Agency tracts, Ceded Districts, etc., in particular, is quite inadequate. It is unfortunate that practice in rural areas has not yet become popular among the men who pass out every year from our medical schools and colleges; but there is unlimited scope for work in this direction, and money too for keen and capable men. In view of this scarcity great value is to be attached to the institution of itinerating dispensaries in rural areas, which take both doctor and drug to the very doors of the sick and the suffering. The founding and maintaining of large institutions is beyond the means of most local bodies, and Government does not demand it of them. But, with regard to the smaller hospitals and dispensaries, the case is wholly different. The founding and maintenance of such institutions is one of the primary duties of local bodies. It is also one of the most laudable objects, to which public funds and private charity may be applied. It is now recognized that to education—even secular education—trust funds of temples and other religious and charitable endowments may be legitimately applied. Is it too much to ask that sanitation and medical relief be treated in the same way as education, so far as the application of those charities is concerned? The wealthy classes should realize that a great deal of suffering may be relieved by founding and maintaining medical institutions—especially institutions for women and children. To make provision for the relief of suffering humanity is one of the most pious and laudable ways of spending a portion of their accumulated wealth—

wealth, which, in theory at least, they are supposed to hold in trust for the benefit of all humanity. What better use can there be for this wealth than in ministering to the needs of the sick and the suffering?

3. *New institutions.*—Among the new institutions opened during the year special mention must be made of the King Edward VII Tuberculosis Institute, which was opened on the 15th of July 1916. The new Royapuram hospital which has replaced the time-honoured Native Infirmary was also completed and is to be opened in July of this year. A fine hospital on the latest type-design was opened this year at Salem by Sir P. S. Sivaswami Ayyar, K.C.S.I., C.I.E. A post-operation ward was built here by two mirasidars in memory of their father, and an infectious diseases ward for caste people by another gentleman. It is hoped that this example may be followed elsewhere. That more new institutions have not come into existence is due to financial conditions being unfavourable, not to any lack of demand for them from the people of the districts. The country people would be only too glad to get them, for appreciation of western medical treatment is now universal in this Presidency. It is largely a matter for local boards and private charity to hasten the time when every taluk will have its hospital and every important village its dispensary. Before, however, hospitals and dispensaries can be thus multiplied we must have more medical men—and what is more important, more medical *women*—willing to set up practice in villages and rural tracts. Meanwhile measures are being taken to mitigate some of the outstanding defects of the present situation and some of these will be dealt with here.

4. *Prevention of hospital abuse by the well-to-do.*—The recent proposal of Government to charge the well-to-do a small sum for medicines at all State hospitals and dispensaries and to levy adequate fees for in-patient treatment are intended to serve the purpose of keeping these institutions for the free treatment of the poor only. This, the Government believe, will have the effect of discouraging the attendance of persons who can afford to pay fees to private practitioners. It is hoped, therefore, that private practitioners may reap the benefit of an increase in their private practice and be induced to settle in mufassal towns and villages, and that they may be able to make a decent living thereby. This is undoubtedly an important end to strive for, as it will afford the country folk medical relief of a reliable kind.

5. *Itinerating dispensaries.*—The object of these institutions is to provide medical relief in out-of-the-way places where medical aid is scarce, and to supplement the work of stationary institutions in times of epidemics. They are in no sense to be regarded as rivals to stationary institutions or to private enterprise, for from the very nature of things, the relief given at these institutions cannot but be inferior on the whole, to that given at permanent institutions or at the surgery of private practitioners. The system has proved a great success in the United Provinces, where the dispensaries are superintended by junior Indian Medical Service officers, who spend a large part of their time in camp and who perform a large number of major operations on patients collected at fixed localities by the Medical officers in charge of these itinerating institutions. In the Madras Presidency, the first experiment in this direction was made as early as 1910 in the Chodavaram division of the Gōdāvari Agency and in some other districts mainly to afford relief from malaria; but, this first experiment was rather disappointing, chiefly because it was found that sub-assistant surgeons are not suitable for the charge of such dispensaries without proper training and supervision. To remedy this defect, special courses of training were instituted, and dispensaries on re-modelled lines and in charge of trained sub-assistant surgeons, were tried in the districts of Vizagapatam, Gōdāvari, Kurnool and Salem. Even this second experiment was not without defects, chief among which was the lack of proper supervision, and the difficulty sub-assistant surgeons found in getting into touch with the villagers and village officers, with whom they had no influence. To remedy these defects to some extent, the Government have now directed that the sub-assistant surgeons in charge of these dispensaries should, as far as possible, arrange their tours so as to meet Revenue officials in villages within their field work and that the District Medical and Sanitary Officer should, in each case, draw up a plan of operations for their guidance in consultation with

the Collector of the district. Subject to these safeguards, seven experimental dispensaries are now working in the districts of Ganjām (Serango and Kaveti), Vizagapatam (Kistnadevipeta), Gōdāvari (Chodavaram), Kurnool (Nandikotkur), Chittoor (Chittoor) and South Arcot (Aziznagar). The scope of their work is mainly confined to treatment of malaria, although it is likely to be widened as time goes on. As, however, sub-assistant surgeons have not sufficient personal influence with the rural population, I proposed in March 1915 that dispensaries similar to those started in the United Provinces should be established in this Presidency and placed in charge of selected Civil Assistant Surgeons, the Presidency being divided into circles for the purpose. In G.O. No. 141, dated 30th November 1916, the Government expressed general approval of this proposal, and sanctioned the establishment of such dispensaries in Cuddapah and Bellary districts and in the districts of Nellore and Chingleput served by the Buckingham canal, the dispensary in this region being housed in a canal boat. The civil assistant surgeons in charge of these dispensaries are not to be allowed private practice, as it is feared that their programme of work might thereby be interfered with. The matter is now under correspondence with the district boards concerned, but it is hoped that these dispensaries, which are fitted up so as to be suitable for the performance of major operations and of affording relief in disease of every sort, will be a great success, and help to solve the problem of bringing medical relief to those living beyond the reach of stationary hospitals and dispensaries.

6. *Cholera-parties.*—In the same category, as affording relief to dwellers in the country, come the cholera-parties maintained from Provincial funds and created under G.O. No. 1283 L., dated 5th August 1913. Each of these parties consists of a small staff of sanitary inspectors under the charge of an assistant surgeon and working under the direction of the Sanitary Commissioner. There are now four such parties at work in this Presidency and their work has, on the whole, been favourably reported on.

7. *Extension of medical relief to rural areas by duplicating the medical staff of certain institutions.*—Another measure proposed by Government, to extend medical relief to rural areas, is the duplication of the medical staff of certain existing medical institutions, both the medical officers employed therein being required to tour alternately for a period of one month through the villages within a definite radius of the dispensary. The details of the scheme are at present under consideration and, when sanctioned, will be a means of increasing medical relief in rural tracts.

8. *Extension of medical education.*—To meet the above noted demand for medical men to staff hospitals and dispensaries, steps have been taken by Government to admit more pupils to the Medical College, Madras. But it must be recognized that, if the needs of the country districts are to be adequately met, we must increase the number of medical men who will be content to live in the villages and small country towns. From experience it has been found that the elaborately trained and expensive university graduate will not settle down in the country and be content with the small fees he can expect from villagers and poor agriculturists. Bearing this in mind Government have resolved to do all they can to increase the number of medical men trained in the medical schools of the Presidency. These men, to whom Government have now accorded the title Licensed Medical Practitioner, are given a thorough training for four years in medicine, surgery and midwifery and all underlying scientific subjects. They are therefore fitted to perform all the duties of a medical man and many of them have risen to eminence in the profession. By these men all the smaller hospitals and dispensaries are staffed, and it is found that they are content to settle in small rural towns and villages. They form the backbone of the medical army in the country districts, and are the hope of the villager as regards medical aid. To increase the number of these men Government have sanctioned the increase in the number of pupils in the medical schools, and the increase of the latter from three to four. The syllabus of instruction has likewise been remodelled so as to bring it up to date in all respects.

9. *Improvement of headquarter hospitals.*—A modern hospital is an expensive thing, and, as a rule, beyond the means of the municipality of the ordinary

up-country town, even when helped by the district board. Government have therefore suggested to municipalities of each district headquarters the advisability of handing over to them the hospitals and land on which they stand, Government undertaking to maintain them hereafter as models for each district, the annual municipal contribution being only one-third of the average cost for the past three years. The subject is now under correspondence and it is hoped that a settlement may soon be reached so that Government may assume direct control of all headquarter hospitals in the Presidency.

10. *The medical inspection of school children.*—Medical inspection of school children is a most important matter, and has engaged the attention of Government and, but for the financial stringency caused by the war, it would have been taken up on a large scale. Meanwhile the Government, desirous that something should be done in this direction, ordered as an experimental measure a preliminary examination of school children attending the elementary schools maintained by the Corporation of Madras. This work was entrusted to Lieut.-Col. C. Donovan, I.M.S., and his final report is now before Government. The main points brought out by this investigation are—

(1) Absenteeism is common, about one-fifth among both boys and girls. The cause is suspected to be tuberculosis. If so, then the time has come to institute special schools for such children.

(2) The presence of leprosy among the children in as high a proportion as 5·9 per cent of children examined.

When funds are available it will be desirable to continue and extend such inspections and to adopt measures for the relief of sick and malformed children.

11. *Female medical aid and education.*—It is an encouraging sign of the times that increasing attention is being paid to the subject of female medical aid and education. The introduction of the women's medical service by the Central Committee of the Dufferin Fund will, to some extent, ensure that our larger hospitals at least, are officered by properly qualified medical women. But the supply of women doctors with good qualifications is still small and it is with a view to relieve this situation that the Government has just sanctioned the opening of a Medical School for Women in Madras, which, let us hope, will ere long, expand into a first-rate Medical College for Women. The school is to be staffed by women, and it is hoped that many women will now enter on a medical career who have been hitherto kept back by the natural dislike of having to study along with men.

12. *Nurses.*—The importance of having an adequate nursing staff has long been recognized by the Government and it is certain that all our institutions, especially mufassal ones, would be much more efficient, if they were provided with a properly trained nursing staff. A scheme for providing the mufassal institutions with adequate nursing staff is now before Government, while another, for training nurses at all our large Presidency institutions is being discussed by a special committee appointed for the purpose. Some of the missionary hospitals have consented to take Indian women to be trained as nurses, and in this way it is hoped soon to have a band of capable Indian nurses for work in hospitals for women throughout the Presidency.

13. *Midwives.*—To reduce the excessive infant and maternal mortality in the Presidency, it is necessary to bring adequate medical relief to the mothers, at or about the time of delivery. In the present dearth of medical men and women it is necessary to rely largely on midwives to give aid during childbirth. The number of midwives employed at the close of 1916 was 472 ; and the number of labour cases conducted by them was 39,047 ; but when it is remembered that the number of births registered during 1916 was as many as 1,301,597, it is obvious that an increase in their numbers is a matter of urgent necessity. It is to meet this situation that the Government have now undertaken in G.O. No. 1133, Public, dated 13th June 1916, to provide at Madras, for the training every year of 100 midwives instead of 64 as hitherto. All district boards and 27 municipal councils have expressed their willingness to pay stipends to pupil midwives under training and to guarantee appointment for a large majority of those who pass out every year. But even with this increase, and the addition of the few midwives

who can be trained every year at select mufassal hospitals, the total number will be quite insufficient to meet the needs of this vast Presidency. A large majority therefore of pregnant women in the Presidency must perforce be attended by the ubiquitous barber midwife—a hereditary functionary whose ignorance of even the most elementary principles of surgical cleanliness, is one of the chief causes of maternal death during the puerperium. As it is impossible to abolish the barber midwife we must try to educate her to be less dangerous than she is at present. A most promising scheme to achieve this end has been sanctioned by Government (G.O. No. 345 L., dated 5th March 1917) and is being taken up by district boards and municipalities. It originated in a suggestion made by the District Medical and Sanitary Officer of Salem ; and the first batch of barber women from that town has recently completed the course laid down. From the experience of Salem it seems certain that local interest can be aroused in this most important matter of the management and care of the pregnant woman, and that it is practicable to train barber women at very little expense in simple cleanliness and non-interference. But it rests with local medical men *and the educated portion of the community* to make this scheme a success. Many lives can be saved by this simple means if local opinion insists on trying the plan.

14. *Health Visitors.*—Another scheme for checking excessive infant mortality is the institution of Lady Health Visitors to visit women in their homes, gain the confidence of prospective mothers, advise them regarding the care of their health and that of their babes, and generally to do everything in their power to see that the medical needs of the mother and the child are well looked after. The key to the whole scheme is of course the personality of the Health Visitor. She should be a medical woman, conversant with the vernacular of the locality, and she must possess tact and insight. Adequate hospital accommodation must also be provided where the cases sent in by the Lady Health Visitors can receive proper treatment. Recently the Government have sanctioned an experimental scheme of this kind in one of the divisions of Madras City, and the results of this experiment will be watched with keen interest, more especially because the first experiment which the Corporation undertook in 1907 was altogether disappointing.

15. *House-Surgeons and House-Physicians.*—It is now recognized that the period of five years, which is the minimum time required to obtain any British registrable medical qualification, is insufficient to enable the young practitioner to acquire the practical training, the power of observation and the handicraftsmanship, which are necessary to enable the student to develop into the practical and self-reliant physician and surgeon. The overcrowding of the medical curriculum is now so great that few graduates in England attempt to begin practice without first holding a 'House-appointment' in a good hospital. It is chiefly with a view to give this much-needed practical teaching to our young graduates that the scheme of House-Surgeons and House-Physicians was instituted in this Presidency. It was also hoped that the scheme would lead to increased efficiency of the hospitals where these House-Surgeons and House-Physicians were employed, and that it would provide a valuable test of the character and general ability of aspirants to Government Medical Service. To some extent, all these objects have been already attained, although it is rather disappointing to note that there is an unfortunate tendency to attach more value to the gaining of '100 marks' in the subsequent entrance examination, than to the improvement of professional knowledge, and to look upon the appointment more as a means to an end (to wit Government service) than as a very desirable thing in itself. It is hoped that in time this tendency will disappear. There are at present 29 appointments for House-Surgeons and House-Physicians in the Presidency-State hospitals and in certain selected headquarter hospitals in the mufassal. It would be an advantage if the scheme could be extended to other important headquarter hospitals, so that every graduate passing out of the Medical College should be able to secure a post as House-Surgeon and House-Physician, but the present financial stringency precludes this being done.

16. *First-Aid.*—Although "First-Aid" does not, strictly speaking, come under the category of *professional* medical relief still it may not be out of place to mention in this report that the demand for instruction of this nature, through the

medium of classes held under the auspices of the St. John Ambulance Association, South Indian Provincial Centre, has been steadily growing during the last triennium. Several well-known medical practitioners in the City and in mufassal towns now give instruction to candidates. A Nursing Division of St. John's Ambulance Brigade is in existence in Bellary. Police constables in Madras City and in the mufassal training schools are likewise given a course in first-aid by selected sub-assistant surgeons.

17. *Health lectures.*—In order to foster the growth of what may be called the 'sanitary conscience' among the masses, and to arouse in them interest in such vital problems as first-aid, pure water, pure milk, cleanliness, sanitary precautions against disease-producing germs, etc., the Government have instituted a series of Health lectures in English and the vernaculars in Madras City and in certain selected districts in the mufassal as an experimental measure. Lectures in English were delivered in 1915 on a variety of subjects by well-known Government medical officers and private medical practitioners. These lectures were very well attended and have undoubtedly done a great deal in *educating* the public. Lectures in the mufassal have been delivered with great success by selected civil assistant surgeons—in the Cuddapah and Kistna districts in Telugu and in the Tanjore and Tinnevelly districts in Tamil. The lectures in Madras City and in the districts were fully illustrated with magic lantern slides. Their success was undoubted and it is hoped this scheme may be extended in future years.

18. *Patients treated—Statements B, D_1, D_2 and E.*—The total number of patients treated at the State-public, local fund, and private-aided dispensaries and hospitals showed a steady general increase during the triennium under review, being 7,562,890 in 1916, against 7,130,302 in 1915 and 6,743,718 in 1914; of these the number that received treatment at the Madras institutions was 372,172 in 1916, against 361,371 in 1915 and 352,153 in 1914, while those that received treatment at mufassal institutions numbered 7,190,718 in 1916, against 6,768,931 in 1915 and 6,391,565 in 1914. The attendance at hospitals and dispensaries varies in this country in a very marked manner. Thus an outbreak of cholera, small-pox, malaria or any other epidemic, may swell the attendance during any particular year, and on the other hand, an outbreak of plague may be the cause of fluctuation in a reverse direction due to evacuation, migration and so on. The increase or decrease in the number of private practitioners is another obvious cause of variation, as is also the personality of particular incumbents, who happen for the time being, to be in charge of our several medical institutions. But, judging from the steady increase in the attendance, observed during the whole of the triennium, it is evident that treatment at Government hospitals and dispensaries has increased steadily in popularity. The number of in-patients treated during the year 1916 was 98,370 against 90,867 in 1915 and 91,565 in 1914, showing a daily average attendance of 4,125·24 in 1914, 4,117·24 in 1915, and 4,270·04 during 1916. The total number of beds available at the close of 1914 was 5,901 (3,305 for males and 2,596 for females) which was increased to 5,993 (3,325 for males and 2,668 for females) at the close of 1915, and to 6,385 (3,543 for males and 2,842 for females) at the close of 1916. The percentage of deaths showed a satisfactory decline from 5·03 in 1914 to 4·54 in 1915 and to 4·11 in 1916. The number of out-patients treated during the year 1916 amounted to 7,464,520 against 7,039,435 in 1915 and 6,652,153 in 1914, showing a steady increase in daily average attendance from 41,073·62 in 1914 to 43,098·11 in 1915 and 46,123·87 in 1916. The number of those that were shown as 'represented by friends' which was 439,389 in 1914, increased to 474,483 in 1915 but has begun to show a satisfactory decline during the year 1916, the actual figure being 445,477, i.e., 29,006 less than in 1915.

19. The total number of patients treated at the State-special and Railway institutions was 276,902 in 1916 (11,026 in-patients and 265,876 out-patients) against 270,892 in 1915 (11,295 in-patients and 259,597 out-patients) and 280,695 in 1914 (11,552 in-patients and 269,143 out-patients). The fall in out-patient admissions observed during 1915, was compensated by the rise in 1916, and this fluctuation is in general agreement, with the corresponding fall in 1915 and a compensatory rise in 1916, that are observable in the returns of the three other classes of medical institutions mentioned above. The number of beds available at

the State-special institutions is now 560 (558 for males and 2 for females), against 561 in 1915 (553 for males and 8 for females) and 542 in 1914 (534 for males and 8 for females).

20. The number of patients treated at the private non-aided medical institutions showed a steady increase during the whole of the triennium, being 370,725 in 1916 (15,175 in-patients and 355,550 out-patients) against 335,200 in 1915 (11,900 in-patients and 323,300 out-patients) and 333,451 in 1914 (12,272 in-patients and 321,179 out-patients). The number of beds provided also showed an increase from 884 in 1914 (312 for males and 572 for females) to 973 in 1915 (328 for males and 645 for females) and 1,107 in 1916 (366 for males and 741 for females). It is satisfactory to note that, on the whole, these institutions are serving an increasingly useful purpose, especially in the direction of affording medical relief to women, as may be seen from the following figures; during 1916, the number of females treated amounted to 197,402 against 173,323 males treated during the same period; the corresponding figures for 1915 and 1914 being respectively 177,912 and 166,641 females and 157,288 and 166,810 males. In the other classes of dispensaries, the position is not so satisfactory; thus, the number of females treated during 1916 at the several State-public, local fund and private-aided dispensaries was 2,571,865 against 4,991,025 males treated during the same period, the corresponding figures for 1915 being 4,709,983 males and 2,420,319 females and 4,448,015 males and 2,295,703 females during 1914.

21. Of the total number treated, Hindus formed 74·12 per cent in 1916 against 73·95 per cent in 1915 and 73·90 per cent in 1914, while the corresponding figures for Mussalmans were respectively 12·67 per cent, 12·72 per cent and 12·62 per cent, for Europeans and Anglo-Indians, 0·94 per cent, 1·00 per cent and 1·10 per cent, while the figures for 'all others,' were 12·27 per cent, 12·33 per cent and 12·38 per cent. According to the census of 1911, the distribution of population by communities was 80·19 per cent Hindus, 11·40 per cent Mussalmans, 2·80 per cent Europeans and Anglo-Indians and 5·61 per cent all others. It is not possible by merely correlating the sets of figures given above to say to what extent the several communities enjoyed health or suffered from sickness, as the circumstances of the communities vary so much; but the above figures will serve roughly to indicate the extent to which the medical institutions are resorted to, by the several communities constituting the population of this Presidency.

22. *Diseases treated—Statements C_1, C_2, D_1, D_2 and E.*—Diseases which account for the largest numbers of admissions, show little variation throughout the whole of the triennium. Thus 'diseases of the skin' always head the list. There were 1,756,897 admissions from these diseases in 1916 against 1,606,411 in 1915 and 1,501,848 in 1914. Next to skin disease, digestive troubles are the most common, the admissions under 'Diseases of the Digestive System' being 1,416,848 for 1916 against 1,357,632 in 1915 and 1,290,213 in 1914. Eye diseases come next, admissions for which numbered 739,571 in 1916 against 627,356 in 1915 and 584,085 in 1914. Next in order come malaria, injuries, diseases of generative system, venereal diseases (syphilis and gonorrhœa) and so on. A very careful analysis of the returns of the diseases treated at any institution is necessary before we can judge the work of the medical officer at that particular institution; and I venture to suggest to all visitors, especially to official visitors, not to judge the work of medical officers merely by the number of cases treated; for as long as mere numbers form the main criterion of the usefulness or popularity of any medical officer, it will be altogether against his own interest to wipe out epidemics of scabies, malaria and other similar diseases.

23. *Infectious diseases.*—The first thing that strikes one when studying the returns of diseases treated, is that patients suffering from infectious diseases do not seek admission in large numbers. Probably one of the most important causes of this unpopularity is that the provision for the treatment of infectious diseases is almost everywhere unsatisfactory. Even where some sort of building is set apart for the purpose, the provision for staff and equipment is meagre, while often the situation of the building itself in some out-of-the-way, forlorn corner, is such that the people dread being treated in it as much as they do the grave or the burning ghat. Even our premier municipality, the Corporation of Madras, has not yet solved

the problem of making adequate provision for the treatment of infectious diseases, although it is satisfactory to note that the authorities concerned have now begun to face it. It is very necessary that there should be a properly equipped and staffed hospital for infectious diseases in the City of Madras. So far as the mufassal is concerned, the only practicable solution just at present is to have a ward for infectious diseases attached to every large hospital, adopting suitable precautions against the spread of infection, and to abandon the old custom of locating the wards in lonely places where patients are afraid to live.

24. *Malaria.*—Admissions for malaria are still unfortunately high, being 554,195 in 1916 against 532,187 in 1915 and 508,578 in 1914; but it is encouraging to note that in places where systematic anti-malarial operations have been carried out, admissions for this disease show a decided decline. This is specially the case in Madras City where the number of admissions for 1916 amounted to 28,933 against 41,398 in 1915 and 45,692 in 1914. The epidemic that attracted attention in Madras about the year 1912 seems to be now well on the decline. The result of systematic anti-malarial operations carried on in the vicinity of Ennur and Tiruvottiyur is seen in the drop of malarial admissions from 3,113 in 1914 to 1,410 in 1915 and 1,325 in 1916. On a fear being expressed in some quarters of a possible outbreak of malaria at Ootacamund, a special malaria officer was appointed to investigate the same; and his investigations appear to show that the fear is groundless and that there is no danger of any malarial epidemic breaking out at Ootacamund in the near future. Further investigations are at present being made at the laboratory of the Pasteur Institute at Coonoor to discover whether the mosquitoes found at Ootacamund can transmit malaria or not.

25. *Tuberculosis.*—The number of admissions for tuberculosis was 18,171 during 1916 against 15,930 in 1915 and 15,999 in 1914. In recent years much attention has been paid to this subject; and the 15th of July 1916, the day on which the "King Edward VII Memorial Institute for Tuberculosis" was opened to the public, will always be remembered as marking a new era in the campaign against this scourge in Madras. The statistics of the Presidency point towards an increase in the incidence of the disease and the Director of the Tuberculosis Institute in Madras infers from statistics collected by him that there is a "wide prevalence of tuberculosis in the City of Madras," especially among the students and clerks who form the large majority of cases treated at the Institute. It is quite true that there are differences of opinion on this point, and some would attribute the observed increase in incidence, to better diagnosis and such other causes, rather than to an actual increase in the prevalence of tuberculosis. But there can be no manner of doubt that the modern economical, industrial and sociological changes of India tend towards increased prevalence of this insidious disease; and the movement for establishing special institutions for the treatment of tubercular cases has not been started a moment too soon. Proposals are now under consideration for opening a tuberculosis ward at each headquarters hospital.

26. *Leprosy.*—The number of admissions for leprosy was 8,399 in 1916 against 7,667 in 1915 and 7,159 in 1914. These numbers represent of course only a small portion of our total leper population; the number of institutions for receiving lepers are few and consequently a considerable number are everywhere found to be at large as professional beggars, sweetmeat-vendors and so on. The danger of permitting this state of affairs to continue is obvious. Then again, there is the terrible fact revealed by Colonel Donovan's medical inspection of school children, that nearly 6 per cent of the children inspected showed leproid patches. Everything points to the urgent need for bringing the Lepers' Act into force in this Presidency; but this cannot be done until the Leper Asylum at Chingleput is ready. Plans for this asylum have been sanctioned, and it is hoped that money may soon be found for the buildings. The new method of treatment introduced by Sir Leonard Rogers, I.M.S., is being tried at the Government Leper Hospital, Rāyapuram and the Superintendent reports that the results have so far been encouraging.

27. *Cholera.*—The number of admissions under this heading amounted to 2,511 in 1916 against 3,559 in 1915 and 8,192 in 1914. Rogers' method of treating

cholera cases by administration of potassium permanganate coupled with injections of hypertonic salines whenever necessary, has been tried with good results at the Infectious Diseases' Hospital, Royapuram, but this method can be employed only by those specially trained in the technique of the operation and in places where skilled assistance is available. The part played by our cholera parties in checking the spread of epidemics has already been referred to. They are always in requisition, and have acquitted themselves creditably and earned a good name wherever they have gone.

28. *Labour cases.*—During the year 1916, 42,244 normal and 5,087 abnormal labours were conducted by the staff of our medical institutions against 37,293 normal and 4,273 abnormal cases in 1915 and 36,502 normal and 4,284 abnormal cases in 1914. It is an encouraging sign that the number of normal cases conducted by qualified persons is showing a definite increase; for, the object aimed at in giving aid in maternity cases is not merely to treat abnormal cases but what is of even greater importance, to prevent normal cases from becoming abnormal. It is not until this is fully recognized that we can hope for the approach of that millennium when every expectant woman will be placed under the care of a qualified person sufficiently early to provide against serious complication, and when we shall hear no more of maternal deaths from preventable causes.

29. *Venereal diseases.*—The number of admissions for gonorrhœa and syphilis was 115,046 in 1916 against 112,029 in 1915 and 110,977 in 1914. These figures will serve to show the increasing prevalence of venereal diseases in our Presidency and the need to take steps for their prevention. The problem of dealing with venereal diseases is a very difficult one, but the recommendations of the recent Royal Commission on Venereal Diseases will serve as useful guides for future policy in India. The matter is at present under the consideration of Government.

30. *Small-pox.*—The number of cases admitted during 1916 numbered 1,167 against 714 in 1915 and 692 in 1914. The city of Madras was visited by an epidemic during 1915 and 1916 and a few cases are occurring even now. The lack of a proper Isolation Hospital for Madras was much felt during the height of the last epidemic; and the same want is observable in many other parts of this Presidency. It is hoped that the steps now being taken in Madras to remove this long-felt want will soon materialize in the shape of buildings. Of the patients treated at the hospitals, the condition as regards vaccination was noted in 665 cases—485 in the city and 180 in the mufassal: the mufassal records were somewhat imperfect; of the 485 cases noted in the city, 364 were protected by vaccination and 121 were unprotected. The death-rate among the former was 4·9 per cent against 42·9 per cent in the latter.

31. *Plague.*—There were 817 admissions for plague during 1916 against 482 in 1915 and 601 in 1914. About the middle of last year, the city of Madras was threatened with an outbreak of plague but, thanks to the prompt action taken by the Corporation authorities, we were happily saved from the threatened calamity. The new notification system is still on its trial.

32. *Hook-worm disease or Ankylostomiasis.*—Special reports were called for and received from all District Surgeons and Medical officers of Jails. No cases of Ankylostomiasis are reported from Bellary, Cuddapah, Anantapur, Guntūr and Nilgiris districts. As many as 103 cases were treated in the General Hospital, the majority of the patients coming from the different divisions of Madras town. In Malabar and Tanjore, 214 and 358 cases of Ankylostomiasis respectively were under treatment. Very few cases are reported from the other districts of the Presidency. Why Malabar and Tanjore districts should contribute such a large number of cases of Ankylostomiasis is not clear. The Civil Jail, Madras, reports no cases, whereas in the Central Jails of Trichinopoly and Rajahmundry 132 and 17 cases, respectively, were treated. The number of patients under treatment for Ankylostomiasis in the district hospitals is obviously no true index of the infection of the general population in the districts. For one thing very few of the mufassal hospitals are supplied with microscopes, which are necessary for the proper diagnosis of this disease.

33. Some fairly accurate idea of the amount of hook-worm infection may be obtained from the reports of Medical officers of Jails, where the fæces of every prisoner are systematically examined for the ova of intestinal parasites. The percentages of hook-worm infection are as follows:—In the jails of Coimbatore and Rajahmundry 32 per cent; Cannanore 21 per cent; Trichinopoly 13 per cent; Vellore 8 per cent; Salem, Berhampur and the Penitentiary, Madras, less than 10 per cent; and Bellary as low as 2 per cent. It is not easy to explain such wide differences; possibly they may serve to indicate roughly the prevalence of the disease in the several areas from which the prisoners of each jail are generally drawn; but it is also possible that differences in technique, and the personal equation of the examiner may also be contributing factors in these wide differences. The Civil Surgeon, Coonoor, classifies the patients examined by him at Coonoor during the period of one month into (1) latrine users, who are town dwellers and (2) free defæcators who form the rural population. The free defæcators are further subdivided into (*a*) close defæcators, being those who work and live on highly cultivated land and are in the habit of defæcating on the land on which they work and often in close proximity to their dwelling lines and (*b*) open defæcators, who are jungle dwellers, living in open and largely uncultivated land and who defæcate in open waste land where no cultivation is being carried on. The result of his examination was practically negative in the case of the latrine users and open defæcators, whereas, even by the admittedly imperfect routine followed, as many as 77 per cent of the close defæcators were found infected. From his observations, it is also seen that town dwellers are generally free from infection by ankylostomiasis, being probably safeguarded, by their habit of using latrines, while the cultivators are for the most part, and probably universally, infected. It is also probable that the more closely the land is cultivated and the more difficult it is for the cultivators to obtain waste land on which to defæcate, the more complete will be the infection of the people by hook-worms. It is reported from the Nellore district that among coolies employed in road-making and kept under strict supervision, 271 men and women were given thymol and 84 of them passed ankylostomes showing a percentage of infection of nearly 31. Among the prophylactic measures suggested is dipping the feet in tar—a somewhat unpleasant form of treatment, but it may not be objected to by our agricultural coolies, among some of whom at least, the habit seems to be already prevalent, as for example, in the districts of Tanjore and Madura, where they are known to cover the soles of their feet with tar before undertaking the transplanting of paddy; and the general impression seems to be that this will help them to avoid what is known locally as "சேற்றுப்புண்" "the ground itch" or "mud itch", said to be produced by working in the miry soil of the fields. This "ground itch" is presumably the first obvious result of the entrance of the embryos of hook-worms into the body. From the reports obtained, it is probable that the disease is present in many, and most probably in all the districts of this Presidency and that the percentage of people harbouring hook-worms is very high indeed. Estate coolies, sweepers, bricklayers, gardeners and farmers are mostly affected with this disease. In the Central Jail, Rajahmundry, 49 per cent of the infected persons are agricultural coolies and 23 per cent cultivators. No caste or religion appears to be exempt; and from a labour and economic standpoint the need for further research is obvious. We need to have an organized campaign against the spread of this disease; and this cannot be arrranged until experimental investigation has shown how far the population is affected, and a study made of the local conditions favouring the liability to attack. This is now being carried out by Dr. Mhaskar at Negapatam, Trichinopoly and Dindigul under the direction of the Indian Research Fund Association, and results have been already secured of great interest and importance (*vide* an article by Dr. Mhaskar on "The Prevalence of Ankylostomiasis in the Madras Presidency" in the Indian Journal of Medical Research for April 1917).

34. *Experimental Work at the Presidency Hospitals.*—Useful experimental work is being carried out in the Government Maternity Hospital in several directions; "Eusol" and "Eupad" are being tried in the septic wards. The use of pituitary extract is being continued, and a large amount of useful knowledge

is accumulating regarding the use of this drug in both normal and abnormal labours. A number of cases of "Fibroid tumours of the uterus" and fibroid changes of the uterus are being treated by X-rays and the results have been reported as being so far very encouraging and the Government have sanctioned the installation of an up-to-date apparatus for carrying out this new treatment which will be erected during the course of this year.

35. The Superintendent, Government Ophthalmic Hospital, reports that "Scarlet R" has been very freely used and been found a most valuable drug in the treatment of many cases of late trachomatous conditions, especially in the slight ulceration and pannus, which sometimes persist after the conjunctival condition has become healthy; it has also been found effective in the treatment of "post-trachomatous Xerosis." He also reports favourably on the treatment of vesicular keratitis by picric acid, and of septic conditions of the conjunctiva, cornea and iris by urotropine in 15-grain doses, every three hours, with concentrated saline, or solution of magnesium sulphate (20 to 35 grain to the ounce) as an useful adjuvant to stimulate the lymph secretions of the part.

36. The "continuous inhalation treatment" for tuberculosis is being tried at the wards of the First Physician, General Hospital, Madras, who reports that "when consistently carried out, it appears to yield, on the whole, better results than any other form of treatment." He also reports that quinodine was used instead of quinine in a number of cases of malaria and was found to act as quickly and efficiently as quinine although the dose never exceeded 8 grains per diem.

37. The First Surgeon, General Hospital, reports very favourably on the treatment of even inoperable cases of infective granuloma by intravenous injections of antimonium tartrate; he adds: "If this treatment prove to ensure permanent cure, it will be an incalculable blessing, especially to those unfortunate cases (most common among females) where the anal canal becomes infected, making life a misery. No other treatment up till now has been of any benefit to the latter cases."

38. The Second Surgeon, General Hospital, in referring to this subject writes: "complete excision of the granuloma and bringing the healthy edges together where possible, is the best treatment; where excision is not possible, X-ray exposures after scraping may be recommended but this is a very tedious method. A sterile solution of two grains of tartar emetic in two ounces of normal saline was injected twice a week. There was remarkable improvement in the local condition, but both the patients left the hospital when they were relieved of their complaint. Further observations are necessary."

39. The Superintendent, Leper Hospital, Rāyapuram, reports that "an interesting experiment was carried out at the instance of Col. R. Bryson, I.M.S., in reference to an article that appeared in the British Medical Journal of the 4th December 1915, in which the value of Rontgen Rays was useful in making a diagnosis where the usual classical symptoms (of leprosy) were absent. Major C. H. Leet Palk, I.M.S. (retired), very kindly undertook to take the radiograms and 63 cases in various stages were examined and a special report will be sent by Col. R. Bryson, I.M.S., and Major C. H. Leet Palk, I.M.S. (retired)."

40. *X-ray treatment.*—The total number of cases treated by the X-ray department of the General Hospital, Madras, amounted to 1,902 in 1916 against 1,714 in 1915 and 2,292 in 1914. The decrease in the year 1915 was due to the fact that treatment by X-ray exposures, which amounted to 1,278 in 1914, numbered only 337 in 1915, as it was then decided not to continue the treatment in a large number of cases where experience had shown that it was unsuitable. Skiagraphy however showed a steady increase from 643 in 1914 to 933 in 1915 and 943 in 1916; and it is now becoming increasingly useful to both physicians and surgeons. Ionic medication was used in 63 cases during 1916 against 29 in 1915 and 39 in 1914; and it is reported to have been of great value in cases of Neuregias and Neuritis.

41. *Operations* (*Statements G, C_1, C_2, D_1, D_2, and E*).—The proportion of patients operated on, to the total treated remained practically the same (about 4 per cent) throughout the triennium under report. The nature of the

operations has also varied but little from year to year, the most common being "Operations for abscesses", "Operations on skin and subcutaneous tissues," "Operations on ear and its appendages," "Operations on the male generative organs," "Obstetrical operations" and so on. The total number of operations performed during 1916 at the State-public, local fund and private-aided institutions amounted to 295,742 in 1916 against 282,167 in 1915 and 259,566 in 1914. Of these, the number of operations performed on in-patients amounted to 35,452 in 1916 against 30,914 in 1915, and 26,807 in 1914. Correlated with this steady increase in the number of operations, there was a steady and satisfactory decrease in the mortality rates, among the patients operated on. Thus, the percentage of mortality among in-patient operations (which, of course, require both great operative skill and careful subsequent attention) was only 1·61 in 1916 against 1·89 in 1915 and 2·13 in 1914, while the death-rates calculated on the total number of operations (both in-patients and out-patients) also showed a decline from 0·24 per cent in 1914 to 0·22 per cent in 1915 and 0·21 per cent in 1916. The total number of operations performed in the city institutions rose from 26,777 (9,323 in-patients and 17,454 out-patients) in 1914, to 31,589 (12,590 in-patients and 18,999 out-patients) in 1915 and 33,542 (14,285 in-patients and 19,257 out-patients) in 1916. The total number of operations performed at the mufassal institutions amounted to 262,200 (21,167 in-patients and 241,033 out-patients) in 1916, against 250,578 (18,324 in-patients and 232,254 out-patients) in 1915 and 232,789 (17,484 in-patients and 215,305 out-patients) in 1914.

42. From the above, it will be seen that the proportion of in-patient operations to out-patient operations is much greater in the city institutions than in the mufassal ones; thus, the number of in-patient and out-patient operations performed in the city institutions during the triennium under report are respectively 36,198 and 55,710, while the corresponding figures for the mufassal institutions are respectively 56,975 and 688,592; in other words, the proportion of in-patient operations to out-patient operations is roughly as 1 : 1·5 for the city and as 1 : 12 for the mufassal.

43. The total number of selected operations performed during the year 1916 amounted to 16,368 (5,080 city and 11,288 mufassal) against 14,823 (4,465 city and 10,358 mufassal) in 1915 and 13,874 (3,417 city and 10,457 mufassal) in 1914. Among those that performed the largest number of selected operations are the following:—

I. *General Surgery.*—(1) Lieut.-Col. W. J. Niblock, I.M.S. (First Surgeon, General Hospital, Madras) with a total of 352, of which abdominal sections numbered 42, operations on intestines including hernia 86, operations on testicles and spermatic cord 88, operations on elephantoid scrotum 14, operations on skull, brain and spinal cord 9, and operations on arteries and veins 7. Among interesting cases successfully operated on and reported by him are a case of Angioma communicating with the longitudinal sinus, a case of aneurism of right external iliac artery and a case of strangulated interstitial hernia with undescended right testis. He also reports that several inoperable cases of infective granuloma of the pudenda were treated by intravenous injections of Tartar Emetic and that the results were most gratifying.

(2) Lieut.-Col. E. M. Illington, I.M.S. (District Surgeon, Vizagapatam) with a total of 320 (excluding ophthalmic, obstetrical, and gynæcological operations which numbered 126) of which abdominal sections numbered 58, operations for hernia 70, operations on testicles and spermatic cord 87, operations for elephantoid scrotum 22 and one case each of adenoma of thyroid and cystic goitre.

(3) Lieut.-Col. R. Bryson, I.M.S. (Rāyapuram Hospital) with a total of 134 operations of which 13 were for radical cure of hernia, 30 for stricture of urethra, and 37 for radical cure of hydrocele. He also makes the following instructive statement regarding the treatment of syphilis by injections of Salvarsan:—"10 intravenous injections of Salvarsan and 10 of Neo-Salvarsan were given to 20 patients. In 18 cases Wasserman's test was found to be positive; in 10 cases, which remained in hospital for treatment with mercury, the blood, examined again after three months, showed a negative reaction. In most cases, treatment is very unsatisfactory, as, soon after the exhibition of Salvarsan, the patients

improve so much that they leave the hospital, in spite of advice to stay on longer."

(4) Major A. Chalmers, I.M.S. (2nd Surgeon, General Hospital), with a total of 275, of which abdominal sections numbered 21, operations on intestines (including hernia) 43, operations on testicle and spermatic cord 62, operations on elephantoid scrotum 14, and operations on skull, brain and spinal cord 5. He also reports that 30 cases were operated on under spinal anæsthesia and that the results were, on the whole, satisfactory.

(5) Dr. T. M. K. Nedungadi (Senior Civil Assistant Surgeon and Third Surgeon, General Hospital, Madras), with a total of 402, of which abdominal sections numbered 13, operations on intestines including hernia 68, operations on testicles and spermatic cord 94, operations on elephantoid scrotum 12, operations on skull, brain and spinal cord 9; among the interesting and successfully operated cases reported by him are a case of large cyst connected with the pancreas and adherent to stomach and transverse colon, a case of big dermoid cyst over the whole of the upper part of scalp and a case of chronic tubercular arthritis of hip with sinusses leading to the joint where "complete excision with scraping of the acetabulam gave the patient (a police constable, aged 20) a painless joint and a fresh lease of life."

(6) Dr. R. Ganapati Ayyar (Civil Assistant Surgeon, Royapettah Hospital), with a total of 449 operations among which abdominal sections numbered 8, 48 were operations for hernia, 136 operations on testicles and spermatic cord, 17 operations on elephantoid scrotum, 7 cases of opening into mastoid antrum and a case of removal of uterus.

II. *Special Surgery* (*Obstetrical and Gynæcological cases*).—(1) Major Hingston, I.M.S. (Superintendent, Government Maternity Hospital, Madras), with a total of 324, of which 75 were obstetrical operations while abdominal sections (for non-obstetrical purposes) numbered 241, and 8 cases of vaginal hysterectomy.

(2) Dr. Mrs. M. Bradley (Lady Apothecary, Lady Havelock's Hospital, Cocanada), with a total of 256 obstetrical operations.

(3) Dr. Miss F. A. Scott (Women's Medical Service and Superintendent, Victoria Caste and Gosha Hospital, Madras, with a total of 133 (for $7\frac{3}{4}$ months) of which 120 were obstetrical operations and 13 were abdominal sections (for non-obstetrical purposes).

III. *Ophthalmic Surgery.*—(1) Major H. Kirkpatrick, I.M.S. (Government Ophthalmic Hospital, Madras), with a total of 1,557 operations of which extraction of lens numbered 986, excision of lachrymal sac 186, sclero-corneal trephining (Elliot's operation) for glaucoma, 95.

(2) Lieut. H. C. Craggs, I.S.M.D. (Government Ophthalmic Hospital, Madras), with a total of 379, of which extraction of lens numbered 297, excision of lachrymal sac 22, and Elliot's operation for glaucoma 10.

(3) Dr. H. R. Sadasiva Rao (Civil Assistant Surgeon, Ellore, Kistna district), with a total of 242 (excluding 38 cases of non-ophthalmic surgery) of which extraction of lens numbered 213 and three were cases of extirpation of lachrymal sac.

44. The total number of operations performed in State-special institutions was 1,219 during 1914 (517 in-patients and 702 out-patients), 2,292 during 1915 (464 in-patients and 1,828 out-patients) and 1,676 in 1916 (520 in-patients and 1,156 out-patients) while the corresponding numbers for Railway institutions was 4,751 in 1914 (6 in-patients and 4,745 out-patients), 5,220 in 1915 (11 in-patients and 5,209 out-patients), and 4,496 in 1916, of which only two were in-patients both ending fatally, and 4,494 were out-patients.

45. The number of operations performed in private-aided institutions during 1916 numbered 19,824 with 23 deaths (0·12 per cent), against 16,225 with 31 deaths (0·19 per cent) in 1915 and 14,261 with 34 deaths (0·24 per cent) in 1914. These records are satisfactory and bear good testimony both to the increased popularity and the excellence of surgical work done at these institutions.

46. *Finance—Statements H and J.*—War-economy has appreciably affected our finances, especially in the matter of Government contributions. Public subscriptions were rather disappointing; and in spite of instances of individual generosity

the normal income from subscriptions is still very meagre, and the collections of our Poor-fund boxes are not large.

47. The total receipts for Madras City (exclusive of opening balance) amounted to Rs. 8,71,251 in 1916 against Rs. 9,41,855 in 1915 and Rs. 10,72,463 in 1914; of this, the Government contributed Rs. 6,28,184 in 1916 against Rs. 7,29,551 in 1915 and Rs. 8,43,043 in 1914; Local Fund and Municipal contributions amounted to Rs. 1,49,701 in 1916 against Rs. 1,41,294 in 1915 and Rs. 1,45,060 in 1914. The public subscribed Rs. 17,898 in 1916 against Rs. 12,802 in 1915 and Rs. 31,134 in 1914. Interest on investments and miscellaneous receipts amounted to Rs. 75,468 in 1916 against Rs. 58,208 in 1915 and Rs. 53,226 in 1914. The expenditure for the year 1916 amounted to Rs. 8,68,578 against Rs. 9,51,649 in 1915 and Rs. 10,73,664 in 1914. There was an all-round economy in the matter of expenditure. The expenditure on buildings and repairs was reduced to the barest necessities being Rs. 82,679 in 1916, against Rs. 85,322 in 1915 and Rs. 2,18,529 in 1914. The average daily cost of diet for each patient was As. 5-8 in 1916 against As. 6-10 in 1915 and As. 6-8 in 1914. Excluding these items (i.e., buildings, diet and investments) the average cost for each patient was Rs. 1-10-5 in 1916 against Re. 1-13-7 in 1915 and Re. 1-14-0 in 1914.

48. The total mufassal receipts (exclusive of opening balance) amounted to Rs. 22,39,876 in 1916 against 22,29,330 in 1915 and 20,90,139 in 1914; of this, the Government contributed Rs. 2,37,604 in 1916 against Rs. 3,82,669 in 1915 and Rs. 3,24,995 in 1914; Local Fund and Municipal contributions amounted to Rs. 18,72,500 in 1916 against Rs. 17,28,582 in 1915 and Rs. 16,50,451 in 1914; the public subscribed Rs. 59,293 in 1916 against Rs. 58,888 in 1915 and Rupees 55,883 in 1914; interest on investments and miscellaneous receipts amounted to Rs. 70,479 in 1916 against Rs. 59,191 in 1915 and Rs. 57,810 in 1914. The total expenditure for 1916 was Rs. 22,40,493 (i.e., an actual slight excess of Rs. 617 over receipts) against Rs. 22,28,593 in 1915 and Rs. 20,91,592 in 1914; the expenditure on buildings and repairs was Rs. 4,17,386 in 1916 against Rs. 5,10,643 in 1915 and Rs. 3,75,814 in 1914; the average daily cost of diet for each patient remained the same, viz., As. 2-7 throughout the whole triennium. Excluding these items (i.e., buildings, diet and investment) the average daily cost for each patient was As. 3-8 in 1916 against As. 3-6 in 1915 and As. 3-10 in 1914.

49. The year 1916 opened with an invested capital of Rs. 6,87,009-10-10 and closed with Rs. 11,86,788-11-10 against Rs. 6,90,265-0-10 in 1915 and Rupees 6,88,389-13-6 in 1914. The comparatively large increase during 1916 was chiefly due to the investments of the Madras Tuberculosis Institute which was opened during the year, and had an invested capital of Rs. 4,94,887-8-0 to its credit on the 31st December 1916.

50. *Medical libraries.*—The district lending libraries are showing satisfactory progress. During the year under report, the number of members increased from 528 to 568 and the number of books from 4,021 to 4,495; the total receipts amounted to Rs. 11,127-1-7 and expenditure to Rs. 5,037-7-10, of which Rs. 4,893-14-10 was expended on books and the rest on furniture and contingencies.

51. *Independent charges held by third and fourth-grade sub-assistant surgeons.*—40 third-grade and 69 fourth-grade sub-assistant surgeons were in independent charge of dispensaries at the close of the year 1916. The main factor which necessitated the employment of as many as 109 junior officers in independent charges, was the strain on the department, caused by the paramount needs of the war.

52. *Inspections.*—I inspected all the Headquarter institutions, the Civil Surgeon charges and the institutions at Bezwada, Dhone, Nandyal, Yercaud and Kotagiri, while the inspections by the District Surgeons were carried out in all but 54 institutions. Stock and service books were duly verified at the stations inspected.

53. *General remarks*: (1) *Tropical School of Medicine at Madras.*—The City of Madras would be an ideal place for the location of a School of Tropical Medicine. It is second to none in India in the matter of its medical institutions and the

richness and variety of clinical material available relating to diseases of the tropics. In proof of this statement it is only necessary to point to the important discoveries made by medical officers working in Madras in connection with the causation of tropical diseases. When the Pathological Institute which is to be attached to the new Medical College is built, it will be possible to create a School of Tropical Medicine second to none in Calcutta or Bombay.

(2) *Research.*—The great need of the hour is "research and more research" and persons with a passion for research. The circumstances of our young medical graduates are not generally such as to allow them to carry on research for the love of it; nor have we any munificent foundations under the auspices of which select students can devote themselves to research work without at the same time having to earn their own livelihood by other work. In this connection, I am happy to report that the Government is instituting a research into the value of indigenous drugs. We are sometimes told that the average western doctor is not in sympathy with indigenous medical science; nothing can be farther from the truth. The man of science knows no distinction between eastern and western science; but is willing to take advantage of whatever good he finds in either. What the western doctor insists upon—and rightly so—is, that all things should be proved before they are accepted, that nothing should be believed on mere authority, and that blatant quackery, which does so much mischief in India, should be exposed and replaced by that which is proved by experiment to be true and useful. The western doctor has already taken a number of the indigenous drugs of all countries into his pharmacopœia and nobody will be more glad than he if the research contemplated bears fruit in this direction. Before any real advance in this direction can be taken it will be necessary to found a chair of experimental pharmacology in Madras and to import a specialist trained in pharmacological chemistry to investigate the active principles of any indigenous drugs that appear to be of real value.

(3) *The Madras Medical Registration Act.*—It was with a view to a wholesome disciplinary control over the practitioners of the western system and to discourage quackery that the Madras Medical Registration Act (Act IV of 1914) was brought into being. There have been some misunderstandings regarding the object and working of this Act: but they are already disappearing and I have no doubt that the Act has a great future before it, in giving a standing to the medical profession, and in conserving those ethical traditions for which in the west it is justly famous. One feature of a pleasing kind that has already made itself manifest, is the better understanding produced between the official and non-official sections of the medical profession in South India.

(4) *Hospital Committees.*—I am glad to note that at Bezwada a committee consisting of the Collector, District Surgeon, the Municipal Chairman and the Assistant Surgeon met and discussed the suggestions made by me at my last inspection. The District Surgeon, Chittoor, also reports the good work done by the hospital committees in this district. A very energetic ladies' committee is in existence at Palamcottah and Tinnevelly which has done excellent work in collecting money for the Women's Hospital at Vanarpet, and in looking after the internal arrangements of the institution. I should like to see similar hospital committees organized all over the country and the members thereof taking a personal interest in their own local medical institutions.

54. *The Medical Services.*—It is my pleasing duty to place on record my high appreciation of the way in which the members of the Madras Medical Service have worked in face of the situation caused by the war. All but sixteen Indian Medical Service officers were reverted to military duty, twelve of whom were working in the city, three were in administrative charge of the Vizagapatam, Madura and Nilgiri districts and one was at the Pasteur Institute. Leave out of India for the Indian Medical Service has been stopped, and the only way leave in India could be got was by some other officer doing double work so as to let his comrade have much needed rest. Many have had to do double work under these trying conditions. One retired Indian Medical officer re-entertained is working in the city, while two others are acting as District Medical and Sanitary Officers, Kistna and Coimbatore districts. The Malabar district charge and Coonoor Civil Surgeoncy were held by

private medical practitioners appointed on special terms. All other district charges and Civil Surgeoncies were held by Provincial civil surgeons and civil assistant surgeons except the Civil Surgeoncy at Cannanore which was held by a retired Provincial surgeon re-entertained.

55. Four military assistant surgeons remained on civil duty in the city, the remaining twenty being all reverted to military duty. Seven civil assistant surgeons are on military duty, having been granted temporary commissions in the Indian Medical Service. The number of civil sub-assistant surgeons employed on military duty was 76 up to the end of December 1916.

56. The revised scale of pay for civil assistant surgeons came into effect from 1st March 1916. The important features of the new scheme are (1) the substitution of septennial increments by a time scale rising to Rs. 300; (2) the institution of two senior grades on Rs. 350 and Rs. 325; (3) the grant of the minimum pay of Civil Surgeons to all officiating officers irrespective of their grade. The appointment of a member of this service to the post of professorship of Anatomy at the Medical College, Madras, is a step, which I know, is extremely welcome to its members. On the initiative of Lieut.-Col. Giffard, C.S.I., I.M.S., and as an experimental measure, a course of post-graduate lectures in midwifery was recently delivered by that officer at the Government Maternity Hospital. A large number of assistant surgeons from the mufassal attended on duty, and the course proved an unqualified success. I was myself present at every one of these lectures, and can assure Government of their great value from the practical stand-point as they condensed into a few lectures and demonstrations the practical experience gathered from many years' service at the Government Maternity Hospital. It is hoped that other experienced officers may be induced to give similar demonstrations in their special subjects in future years.

57. With a view to improve the attractions of the Sub-Assistant Surgeons' Service, the Government were pleased to introduce into this Presidency the maximum scale of pay sanctioned by the Government of India, for this grade of officers, so that their maximum pay is now raised from Rs. 80 to Rs. 100. They were further pleased to order that all students hereafter passing out of the Medical schools of this Presidency be entitled to call themselves "Licensed Medical Practitioner," with the privilege of affixing the letters L.M.P., after their names. Select sub-assistant surgeons are also now eligible for promotion to the grade of civil assistant surgeons. These are all privileges which have undoubtedly raised the status of the members of this service. The pay of the sub-assistant surgeon is not yet what it should be, but Government are, I am glad to say, favourably considering this question.

58. *Conclusion.*—This being the last triennial report which I shall submit as Surgeon-General with the Government of Madras, I feel it my duty to record my high appreciation of the excellent work that has been, and is being done, by medical officers of all grades. I also desire gratefully to acknowledge the help they have given me in the discharge of my duties as the head of the Madras Medical department.

59. I have found the specialist officers of the Indian Medical Service willing at all times to advise me in matters on which they are authorities, and I have therefore had confidence in advising Government on many points on which I should have felt doubt without the loyal support of my brother officers. For this ungrudging help I desire to thank them.

60. The District and Civil Surgeons have everywhere performed their duties with zeal and enthusiasm. The high standard set by the Indian Medical Service officers before going on war-service has been an incentive to officers of the Provincial Service who have taken their place temporarily, and I have great pleasure in testifying to the praiseworthy manner in which officers of all grades have helped to maintain the best traditions of the medical profession, and that particular branch of it which I have had the honour of controlling for the last six years.

ANNUAL RETURNS.

STATEMENTS A–J.

STATEMENT A.

Showing the Number of Dispensaries in the British Territory (excluding Anjengo). Madras Presidency, during the year 1916.

Population of the Province—41,399,832 (Census of 1911).

Total ...		697	(l) 27	(m) 15	709	

Remarks:

(a) Itinerating Dispensary, Serango (Ganjām), *Government Hospital, Royapuram (Madras).

(b) Itinerating Dispensary, Kaviti (Ganjām), Palacole (Kistna), Gudūr, Nandikotkur, Itinerating Dispensary (Kurnool), Bukkapatam (Anantapur), Chetput (North Arcot), Chunampet (Chingleput) *Infectious Hospital, Royapuram (Madras), Ammapet, Thammampatti and Edapady (Salem), Hanur (Coimbatore), Ammapet, Peralam, Vaithiswarankoil (Tanjore) and Watrap (Rāmnād).

(c) Yadiki (Anantapur), * Georgetown Dispensary, Royapuram (Madras) and Ammapet (Salem).

(d) Gosha Hospital, Tuni (Gōdāvari), Women and Children's Dispensary, Vaniyambadi (North Arcot).

(e) Women and Children's Dispensary, Pollachi (Coimbatore).

(f) King Edward VII Memorial Institute for Tuberculosis, Egmore (Madras).

(g) Branch Dispensary, Waltair (Vizagapatam), * Native Infirmary, Royapuram (Madras), * Codakkal, *Vaniyankulam, *Payyannur (B.M.) (Malabar) and Leper Asylum, Mangalore (B.M.) (South Kanara).

(h) S.P.G. Mission Dispensary, Giddalore (Kurnool), * Codakkal, * Vaniyankulam, * Payyannur (B.M.) (Malabar).

(i) Two Mining Dispensaries (Vizagapatam), A.E.L.M. Dispensary, Palmanair (Chittoor).

(j) Rainy Hospital, Tondiarpet (Madras), A.E.L.M. Dispensary, Tenali (Guntūr).

(k) Mission Hospital, Berhampur (Ganjām), A.E.L.M. Dispensary, Tenali (Guntūr).

(l) Of these, the following 17 institutions have been newly opened during the year:—Serango, Kaviti (Itg.), Gosha Hospital Tuni, Palacole, Gudūr, Nandikotkur (Itg.), Chetput, Women and Children's Dispensary, Vaniyambadi, Chunampet, Tuberculosis Institute, Madras, Edapady, Ammapet, Peralam, Vaithiswarankoil, Watrap, A.E.L.M. Dispensary, Tenali, and S.P.G. Dispensary, Giddalore.

(m) Of these, the following three institutions have been permanently closed during the year:—2 Mining Dispensaries and Leper Asylum, Mangalore (B.M.).

Classes I and II.—These include all institutions maintained by Provincial funds and under Government management. The fact that an institution possesses endowments or receives contributions from Local Funds or private subscriptions should not be regarded as a reason for not classing it as 'State' so long as Provincial and Imperial funds are practically responsible for all the charges connected with it. Class I.—'Public' are State dispensaries which are open to the poorer classes of the public. Class II are State dispensaries which serve only a special section of the public as indicated in the sub-classification attached.

Class III.—Local Fund dispensaries include all institutions which are vested in Local Boards or Municipalities or guaranteed or maintained by Local or Municipal funds. The fact that such an institution is aided by private subscriptions, or receives assistance from Government in the shape of part of the salary of the medical officer, grants of medicine, or otherwise, should not be regarded as a reason for not classing it as a Local Fund dispensary so long as its existence is practically dependent upon Local Funds.

Class IV.—Comprises institutions supported by private subscriptions or guarantee, but receiving aid from Government or Local Funds.

Class V.—Comprises institutions maintained entirely at the cost of private individuals or associations. The fact that Government supplies superior inspection or registers should not be regarded as a reason for not treating it as a private non-aided dispensary.

Class VI.—Comprises all railway dispensaries whether maintained by State railways or others.

Class A = General institutions. Class B = Women and Children's institutions.

* Indicates institutions transferred from one class to another.

STATEMENT B.

Showing the number of In-door and Out-door Patients treated in the State-public, Local Fund and Private-aided Dispensaries of the Madras Presidency during the year 1916.

* The decrease of Rs, 234 as compared with closing balance on 31st December 1915 is due to the closure of the Waltair Dispensary.

† Includes Rs. 368 for construction of a bath room to Nurses' quarters.

Government of Madras

LOCAL AND MUNICIPAL DEPARTMENT (MEDICAL)

G.O. No. 406, 24th September 1917

Triennial returns of Civil Hospitals and Dispensaries

The — in the Madras Presidency for the years 1914—1916 reviewed.

READ—the following paper:—

Letter—from the Hon'ble Surgeon-General W. B. BANNERMAN, C.S.I., K.H.P., M.D., D.SC., I.M.S., Surgeon-General with the Government of Madras.
To—the Secretary to Government, Local and Municipal (Medical) Department.
Dated—Madras, the 25th June/19th July 1917.
No.—63/475.

ABSTRACT.—Submitting the triennial report on the working of the hospitals and dispensaries under the Government of Madras during the years 1914, 1915 and 1916.

Order—No. 406, Medical, dated 24th September 1917.

Recorded.

2. During the greater part of the three years dealt with in the Surgeon-General's report, progress in the extension of medical relief was limited by conditions brought about by the war and it was difficult alike for Government and for local and missionary bodies to find money or men for work among the civil population. There was some progress, however, the total number of medical institutions having increased from 684 in 1913 to 709 in 1916. Among private institutions there was a decrease of seven, but local bodies opened twenty-eight new dispensaries, fourteen of these having come into existence since the issue of G.O. No. 397 L., dated 9th March 1915, in which the Government undertook to bear half the cost of new institutions started by local bodies. The King Edward VII Tuberculosis Institute was opened in Madras in July 1916; the main block of the new hospital at Rayapuram has been completed and opened since the end of the year; new buildings have been, or are being, provided for the hospitals at Salem, Bellary and Vizagapatam and other district hospitals are being improved. In order to raise the general standard without throwing too much expense on the municipalities and district boards, the Government have offered to take over any district headquarter hospital provided that the control is relinquished by the local bodies concerned and that a contribution is made of one-third of the average cost for the last three years.

3. The most noticeable point in the Surgeon-General's report is the increase in the amount of work done in spite of the depletion of the staff of all ranks. Less than a third of the ordinary establishment of Indian Medical Service officers remain in civil employment and, in the past year especially, it has been impossible to keep all the dispensaries open continuously, owing to the shortage of sub-assistant surgeons, but the attendance has gone up almost everywhere. Hospitals, both in Madras and in the mufassal, have been shorthanded but have been kept going by the exertions of the officers in charge; and the number of patients treated and the number of operations performed have been larger than ever before, while the death rate has been lower.

4. Both for war purposes and to fill vacancies in the civil establishment, the ranks of private practitioners have been drawn upon; and in order to increase the number of trained men available, a fourth medical school has been started and

the admissions into the three previously existing schools have been largely increased and some increase has been made at the Medical College. The number of candidates offering themselves for instruction is large and it is under contemplation to open a second medical college when possible and to increase further the number of schools. These developments, however, necessarily take time. The selection of sites, and the preparation of plans and estimates for suitable buildings involve careful consideration which cannot be hurried and as the course of training in a medical school lasts four years and in the Medical College five years, it must be a number of years before the results of the steps now being taken are apparent.

5. There has been no increase in hospitals devoted specially to the treatment of women and children, the chief obstacle being the dearth of medical women to be put in charge of them. The candidates for medical education are few and many of those who offer themselves have not sufficient general education to profit by the training offered in the Medical College and schools. In order to attract women of a better class, who may object to instruction by men and in company with men, it is hoped to open before long a separate medical school for women in Madras. Schemes are in hand for improving the nursing in hospitals both in Madras and in the mufassal; arrangements have been made for increasing the number of midwives that can be trained; and in several district and municipal hospitals, classes have been held for the instruction of midwives of the indigenous type in the rudiments of cleanliness.

6. Fresh rules regarding the levy of fees for medical treatment in the State hospitals in the City of Madras were introduced during the period under report and appear to be working satisfactorily, but the system has not been extended very widely in the mufassal. Many local bodies are unwilling to require patients to pay for treatment, even when they can afford it, generally on the ground that enforcement of payment will render the hospitals less popular; even where fees are charged at all, they are very low. This tendency is to be regretted, for so long as medical treatment is given free of charge to all comers at the State hospitals, the growth of a body of qualified private practitioners must be seriously retarded. There are signs, however, that such a class is springing up and the Government have under their consideration the possibility of giving it further assistance.
